OFFICIAL DISTRIBUTOR OF POTAIN by Manitowoc

Copilot

Potain tower cranes are well-known for their **lifting power, reliability, and innovative designs** ¹. Manufactured by **Manitowoc**, Potain has been a leader in tower crane production since **1928** ¹. They offer a wide range of cranes, including **top-slewing cranes** for large construction sites, **luffing jib cranes** for skyscrapers, and **self-erecting cranes** for smaller projects ¹.

Recently, Manitowoc launched the **Potain MCR 815**, a **luffing jib crane** with a **64-ton maximum capacity**, designed for infrastructure projects like bridges and high-rise buildings ². Additionally, Potain cranes are being used in **Madison, Wisconsin**, to construct a **14-story mixed-use development**, demonstrating their adaptability in tight urban spaces ³.

POTAIN®

OFFICIAL DISTRIBUTOR OF JCB

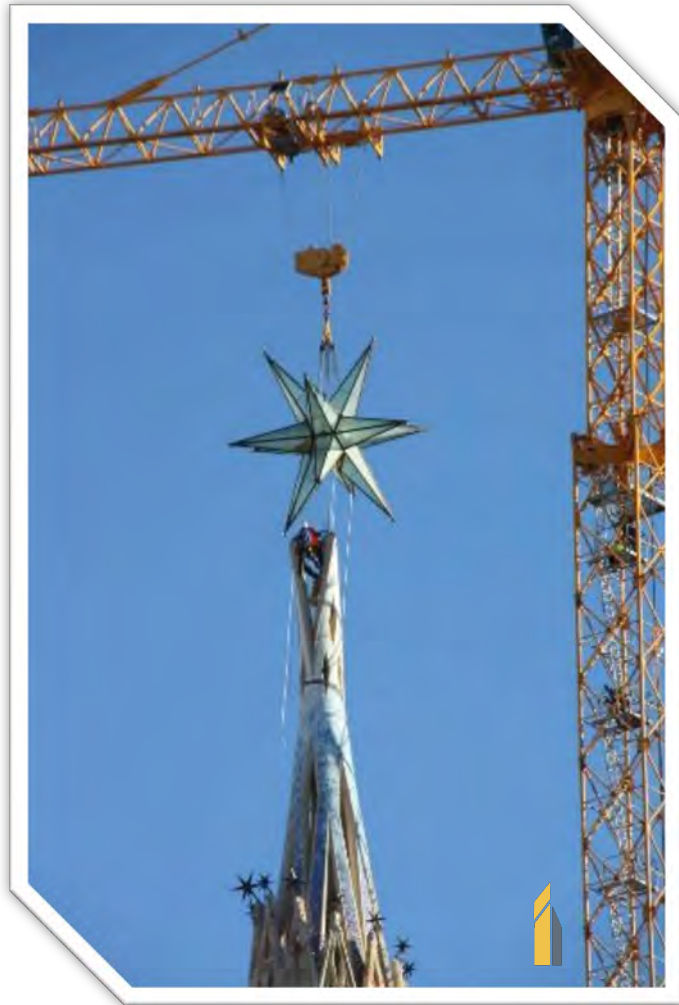

A PERFECT TEAM FOR YOUR PROJECT

REACH THE HIGHEST STANDARDS

Ibergruas = Quality, trust and service.

We assembled up to six cranes simultaneously at the Sagrada Família in Barcelona, some of them on top of the dome. Cranes installed on an architectural gem like the Sagrada Família, arguably the most expensive and costly building in the world. 143 years from the beginning.

To give you an idea of the safety requirements for the project: it has an average of between 13,000 and 16,000 paying visitors per day, and it's estimated that around 22 million people visit the cathedral every year.

LIMITS ARE MADE TO BE
BROKEN

And if all this demand weren't enough, we are able to install a section never seen before: ECCENTRIC and designed exclusively for the Sagrada Familia to withstand all the efforts, all the demands, with complete safety.

LIMITS ARE MADE TO BE BROKEN

This bridge, for example, built by Ibergruas Potain tower cranes in Cáceres, Spain, was the one with the largest span (space from side to side) of the world.

Higher, Stronger, More Potain, More Ibergruas

LIMITS ARE MADE TO BE **BROKEN**

The Chilina Bridge, inaugurated in November 2014, is one of the longest urban bridges in Peru, spanning **562 meters** ¹. It was a significant infrastructure project, connecting various districts in Arequipa and designed to withstand high seismic activity ². While it was a major construction achievement in Peru, determining whether it was the **largest** work globally in 2014 would require comparing it to other major projects completed that year, such as large-scale highways, skyscrapers, or industrial complexes.

Would you like to explore other notable constructions from 2014?

LIMITS ARE MADE TO BE BROKEN

IBERGRUAS SOLD & INSTALLED THE BIGGEST AND HIGHEST CRANE EVER ASSEMBLED IN SPAIN, and one of the biggest in Europe: a POTAIN MD1400 at the Repsol Tower in Madrid, along with two climbing cranes that grew with the building. The big one was later used to dismantle the other two.

1984 2024

Self Stable:

- Without connections to the building.

Self Stable:

- Without joints to the building.
- Unprecedented: We were able to build the Kio towers in Madrid, on the architect's crazy orders, without bracing the building.
- The world's first leaning skyscrapers in 1995
